

AMENDMENTS TO THE CLAIMS

Please amend Claims 25 and 31 as follows:

1 - 21. (Canceled)

22. (Previously Presented) A communication system comprising:

a first apparatus in a wireless network;

a second apparatus in a wired network; and

a communication apparatus that includes a wireless communication unit, a decoding unit, an encoding unit, and a wired communication unit,

wherein the wireless communication unit receives first encoded video data encoded by a first video encoding system from the first apparatus through the wireless network,

wherein the decoding unit decodes the first encoded video data received by the wireless communication unit to provide decoded video data,

wherein the encoding unit encodes the decoded video data into second encoded video data using a second video encoding system,

wherein the wired communication unit transmits the second encoded video data to the second apparatus through the wired network,

wherein the first video encoding system is suitable for a first communication protocol used between the first apparatus and the communication apparatus, and the second video encoding system is suitable for a second communication protocol used between the second apparatus and the communication apparatus, and

wherein the first video encoding system uses a video encoding different from MPEG encoding, and the second video encoding system uses MPEG encoding.

23. (Previously Presented) A communication system according to claim 22, wherein the first apparatus is a video camera, and the second apparatus is an apparatus adapted to record the second encoded video data on a recording medium.

24. (Previously Presented) A communication system according to claim 22, wherein the first apparatus is a video camera, and the second apparatus is an apparatus adapted to display the second encoded video data.

25. (Currently Amended) A communication apparatus comprising:

- a wireless communication unit which receives first encoded video data encoded by a first video encoding system from the first apparatus through a wireless network;
- a decoding unit which decodes the first encoded video data received by the wireless communication unit to provide decoded video data;
- an encoding unit which encodes the decoded video data into second encoded video data using a second video encoding system; and
- a wired communication unit which transmits the second encoded video data to the second apparatus through a wired network,

wherein the first video encoding system is suitable for a first communication protocol used between the first apparatus and the communication apparatus, and the second video

encoding system is suitable for a second communication protocol used between the second apparatus and the communication apparatus, and

wherein the first video encoding system uses a video encoding different from MPEG encoding, and the second video encoding system uses MPEG encoding.

26. (Previously Presented) A communication apparatus according to claim 25, wherein the first apparatus is a video camera, and the second apparatus is an apparatus adapted to record the second encoded video data on a recording medium.

27. (Previously Presented) A communication apparatus according to claim 25, wherein the first apparatus is a video camera, and the second apparatus is an apparatus adapted to display the second encoded video data.

28. (Previously Presented) A method for controlling a communication apparatus, the communication apparatus including (a) a wireless communication unit which communicates with a first apparatus through a wireless network and (b) a wired communication unit which communicates with a second apparatus through a wired network, the method comprising the steps of:

receiving first encoded video data encoded by a first video encoding system from the first apparatus using the wireless communication unit;

decoding the first encoded video data received in the receiving step to provide decoded video data;

encoding the decoded video data into second encoded video data using a second video encoding system; and

transmitting the second encoded video data to the second apparatus using the wired communication unit,

wherein the first video encoding system is suitable for a first communication protocol used between the first apparatus and the communication apparatus, and the second video encoding system is suitable for a second communication protocol used between the second apparatus and the communication apparatus, and

wherein the first video encoding system uses a video encoding different from MPEG encoding, and the second video encoding system uses MPEG encoding.

29. (Previously Presented) A method according to claim 28, wherein the first apparatus is a video camera, and the second apparatus is an apparatus adapted to record the second encoded video data on a recording medium.

30. (Previously Presented) A method according to claim 28, wherein the first apparatus is a video camera, and the second apparatus is an apparatus adapted to display the second encoded video data.

31. (Currently Amended) A communication system comprising:

a first apparatus in a wireless network;

a second apparatus in a wired network; and

a communication apparatus that includes a wireless communication unit, a decoding unit, an encoding unit, and a wired communication unit,

wherein the wired communication unit receives second encoded video data encoded by a second video encoding system from the second apparatus through the wired network,

wherein the decoding unit decodes the second encoded video data received by the wired communication unit to provide decoded video data,

wherein the encoding unit encodes the decoded video data into first encoded video data using a first video encoding system,

wherein the wireless communication unit transmits the first encoded video data to the first apparatus through the wireless network, **and**

wherein the first video encoding system is suitable for a first communication protocol used between the first apparatus and the communication apparatus, and the second video encoding system is suitable for a second communication protocol used between the second apparatus and the communication apparatus, and

wherein the first video encoding system uses a video encoding different from MPEG encoding, and the second video encoding system uses MPEG encoding.

32. (Previously Presented) A communication system according to claim 31, wherein the first apparatus is an apparatus adapted to record the first encoded video data on a recording medium, and the second apparatus is an apparatus adapted to reproduce the second encoded video data from a recording medium.

33. (Previously Presented) A communication system according to claim 31, wherein the first apparatus is an apparatus adapted to display the first encoded video data, and the second apparatus is an apparatus adapted to reproduce the second encoded video data from a recording medium.

34. (Previously Presented) A communication apparatus comprising:

a wired communication unit which receives second encoded video data encoded by a second video encoding system from the second apparatus through a wired network;

a decoding unit which decodes the second encoded video data received by the wired communication unit to provide decoded video data;

an encoding unit which encodes the decoded video data into first encoded video data using a first video encoding system; and

a wireless communication unit which transmits the first encoded video data to the first apparatus through a wireless network,

wherein the first video encoding system is suitable for a first communication protocol used between the first apparatus and the communication apparatus, and the second video encoding system is suitable for a second communication protocol used between the second apparatus and the communication apparatus, and

wherein the first video encoding system uses a video encoding different from MPEG encoding, and the second video encoding system uses MPEG encoding.

35. (Previously Presented) A communication apparatus according to claim 34, wherein the first apparatus is an apparatus adapted to record the first encoded video data on a recording medium, and the second apparatus is an apparatus adapted to reproduce the second encoded video data from a recording medium.

36. (Previously Presented) A communication apparatus according to claim 34, wherein the first apparatus is an apparatus adapted to display the first encoded video data, and the second apparatus is an apparatus adapted to reproduce the second encoded video data from a recording medium.

37. (Previously Presented) A method for a communication apparatus, the communication apparatus including (a) a wireless communication unit which communicates with a first apparatus through a wireless network and (b) a wired communication unit which communicates with a second apparatus through a wired network, the method comprising the steps of:

receiving second encoded video data encoded by a second video encoding system from the second apparatus using the wired communication unit;

decoding the second encoded video data received in the receiving step to provide decoded video data;

encoding the decoded video data into first encoded video data using a first video encoding system; and

transmitting the first encoded video data to the first apparatus using the wireless communication unit,

wherein the first video encoding system is suitable for a first communication protocol used between the first apparatus and the communication apparatus, and the second video encoding system is suitable for a second communication protocol used between the second apparatus and the communication apparatus, and

wherein the first video encoding system uses a video encoding different from MPEG encoding, and the second video encoding system uses MPEG encoding.

38. (Previously Presented) A method according to claim 37, wherein the first apparatus is an apparatus adapted to record the first encoded video data on a recording medium, and the second apparatus is an apparatus adapted to reproduce the second encoded video data from a recording medium.

39. (Previously Presented) A method according to claim 37, wherein the first apparatus is an apparatus adapted to display the first encoded video data, and the second apparatus is an apparatus adapted to reproduce the second encoded video data from a recording medium.

40. (Previously Presented) A communication system according to claim 22, wherein the wired communication unit is adapted to transmit the second encoded video data using an isochronous transfer.

41. (Previously Presented) A communication apparatus according to claim 25, wherein the wired communication unit is adapted to transmit the second encoded video data using an isochronous transfer.

42. (Previously Presented) A method according to claim 28, wherein the second encoded video data is transmitted using an isochronous transfer.

43. (Previously Presented) A communication system according to claim 31, wherein the wired communication unit is adapted to receive the second encoded video data using an isochronous transfer.

44. (Previously Presented) A communication apparatus according to claim 34, wherein the wired communication unit is adapted to receive the second encoded video data using an isochronous transfer.

45. (Previously Presented) A method according to claim 37, wherein the second encoded video data is received using an isochronous transfer.

46. (Previously Presented) A communication system according to claim 22, wherein the first video encoding system uses H.263 and the second video encoding system uses MPEG encoding.

47. (Previously Presented) A communication system according to claim 46, wherein the MPEG encoding is MPEG1 encoding.
